

ABSTRACT OF THE DISCLOSURE

A seat cushion includes a cushion body and a vibrating unit. The cushion body has a rear section adapted to press against the buttocks of a user, and a front section including two spaced-apart thigh support portions, and a protruding portion projecting upwardly between the thigh support portions and adapted to press against the groin portion of the user. The vibrating unit is disposed in the protruding portion for massaging the groin portion of the user so as to promote blood circulation.
